Abstract (en)

[origin: GB2359094A] This invention relates to a fuel composition comprising a base fuel having a final boiling point above 150°C and an anti-foam, characterised in that the anti-foam comprises di-isobutylene in an amount greater than 2.5 % by volume based on the total fuel composition. The addition of this anti-foam reduces the break-up time for any foam formed significantly.
