Abstract (en)

[origin: WO0180395A2] In order to coordinate power generators and consumers in a power network using intelligent management, a method for generating power is provided wherein at least two decentralized power generators are connected to an electric network, supplying said network with power. A value for the current output of at least one power generator is detected and compared to a theoretical output and according to the result, the output of the power generators connected to the electric network is adapted correspondingly.

[origin: WO0180395A2] In order to coordinate power generators (32-35) and consumers (36,37) in a power network using intelligent management, a method for generating power is provided wherein at least two decentralized power generators(32-35) are connected to an electric network (31), supplying said network (31) with power. A value for the current output of at least one power generator(32-35) is detected and compared to a theoretical output and according to the result, the output of the power generators (32-35) connected to the electric network (31)is adapted correspondingly.
