Abstract (en)

[origin: EP1275450A2] The assembly for continuous casting a molten metal into a strip, especially of molten steel, has two axially parallel casting rollers (2,3) which rotate against each other. The rollers define a casting gap (4) between them with side sealing plates (6,7) to contain the well of molten steel over the gap. The side sealing plates have a rotating movement around an axis (10) which is parallel to the roller axes (8,9). The side sealing plates are of a hard material with high wear resistance e.g. zirconium oxide, zirconium borite, aluminum oxide and/or silicon carbide. The ends of the rollers are coated with a wear-resistant cladding (15-18) of a high wear resistant steel, chrome carbide or tungsten carbide, nickel or graphite.
