Abstract (en)

[origin: DE10133226C1] The corner edge bearing has a bearing pin (3) and a bearing seat (25) respectively associated with the door or window panel (5) and the surrounding frame (19), allowing the door or window panel to rotate about a first axis and tip about a second axis. The bearing pin and the bearing seat have a cooperating projection (14) and recess (31), allowing relative movement of the bearing pin and the bearing seat during the rotation and tipping movement of the door or window panel, but preventing removal of the bearing pin from the bearing seat. -
