Abstract (en)
[origin: WO0183175A1] The invention relates to the cutter head (7) of a chipper canter, comprising a frame, a plurality of chipping blades, which are disposed peripherically in connection with the frame at mutual distances, and a circular blade (8), which is mounted in connection with the frame in the vicinity of the chipping blade. The cutter head (7) of the invention also comprises a dressing means (11), whose cutting knife portion (12) is disposed on the saw line of the circular blade (8), the width of the knife portion (12) in a plane perpendicular to the direction of rotation of the circular blade (8) being greater than the width of the teeth (9) of the circular blade in the corresponding plane, and the dressing means (11) being disposed to cooperate with the circular blade (8) for at least partial enlargement of the kerf produced with the circular blade in the wood to be processed. The dressing means (11) is used to enlarge the kerf as it is being formed. Thus a path is provided for the sawdust discharged from the kerf.
