Abstract (en)
[origin: WO0179674A1] The invention relates to a device and a method for controlling a drive unit of a vehicle. A signal which determines output can be predetermined based on the position of an operating element. The adjusting element is controlled in dependence on a filtered signal determining output. The signal is filtered with a filter which has at least one high pass and one low pass which are connected in parallel. The filtering process takes place in such a way that when there is a transition to a modified signal, the filtered signal has at least one corresponding impulse.
