Abstract (en)

[origin: EP1277899A1] The operating mechanism for a vehicle door lock (1) has a handle (2) with a movement damper (3) with a shaft (6) for the handle. The shaft is linked to the handle through damping couplings (7-9), which are moved in and out. The action of the couplings is according to the direction of movement so that, according to the direction (20,21) of handle movement and direction of shaft rotation, the movement is damped or undamped.

[origin: EP1277899A1] The operating mechanism for a vehicle door lock (1) has a handle (2) with a movement damper (3) with a shaft (6) for the handle. The shaft is linked to the handle through damping couplings (7-9), which are moved in and out. The action of the couplings is according to the direction of movement so that, according to the direction (20,21) of handle movement and direction of shaft rotation, the movement is damped or undamped.
