Abstract (en)
[origin: WO0182789A2] Systems and methods relating to the physiological monitoring of a subject are disclosed. A system embodiment for physiological monitoring of a person comprises a monitor module, which monitors a physiological parameter of the person, the module having a wireless transmitter such as a Bluetooth transmitter. The system further comprises an interactive television system, which receives a signal from a remote control unit, such as an IR or other wireless transmission, wherein the received signal is used to modify visual presentations on a display of the interactive television system, such as changing channel, providing numerical data in response to presented menus, selecting from presented menus using navigation keys, and the like. The system further comprises a portable computing device, adapted to receive physiological data transmitted by the monitor module and to store the physiological data in a memory, and which is further adapted to function as the remote control unit of the interactive TV, so as to transmit stored physiological data to the digital interactive television, and to provide a signal for remote control and interaction with the interactive TV.
