Abstract (en)

[origin: EP1279795A1] The present invention is a surface controlled gas lift valve designed for high flow rates and used in a subterranean well, comprising: a valve (8) for sealable insertion in a mandrel, having a variable orifice (16) which alternately permits, prohibits, or throttles fluid flow into the valve, and a detachable and/or remote actuator (20) are disclosed. Methods of actuating the valve include electro-hydraulic, hydraulic, and pneumo-hydraulic, while sensors relay the position of the variable orifice and critical fluid pressures to a panel on the surface. The orifice valve and the actuator while operatively connected, may be separately installed in or retrieved from by either wireline or coiled tubing intervention methods. <IMAGE> <IMAGE>
