Abstract (en)  
[origin: EP1281330A1] An apparatus for shoe manufacture has been conceived which is provided with a shoe-supporting device (3) operatively in engagement with a support frame (2) and with a head block (6) carrying at least one first and one second working tools (7,8) arranged to operate on a shoe (5), as well as actuating means (12) associated with the frame (2) and activated to enable a relative displacement between the shoe-supporting device (3) and the working tools (7,8). The presence of more than one tool on a single work head allows accomplishment of a machine adapted to perform different working typologies on the shoe (5). <IMAGE>
