Abstract (en)
[origin: EP1281628A2] Automatically opening cover for containers, where these containers have in their interior a product that is usually viscous or soapy, which is repeatedly applied, in portions. Its configuration allows the opening of the cover to be carried out by pressing on a push-release, it being unnecessary to carry out any other supplementary action. This cover consists of three parts, a base piece, a lid and an intermediate part that has at its end the opening push-release concerned. The lid remains joined to the base piece by two arms and a central arm. <IMAGE>
