Abstract (en)  
[origin: WO0189487A1] The invention relates to a transdermal therapeutical system in the form of a plaster for the controlled release of active substances to the human or animal skin. The inventive system comprises a backing layer, a reservoir linked therewith that contains the active substance, and a releasable protective layer. The main components of the reservoir containing the active substance include at least one film forming agent and at least one polymer that inhibits or suppresses the crystallization of the active substance(s).
