Abstract (en)

[origin: WO0189766A1] The invention relates to a method for grinding metallic workpieces containing, in particular, nickel, whereby a rotationally driven grinding wheel (2) is continuously dressed by a rotationally driven dressing wheel (3) during the grinding of the workpiece (1) by the continual advance (v_{frd}) of the dressing wheel. In order to increase the grinding capacity, the invention provides that with a dressing advance velocity of 1 to 2 μm per rotation of the grinding wheel and with a circumferential velocity of the grinding wheel (v_s) of at least 45 m/s, the advance (table velocity v_t) is set such that the rate of metal removal is at least 90 mm³/mms.
