Abstract (en)

[origin: WO0188316A1] The invention relates to a motor-vehicle door locking system comprising a motor vehicle lock (2) which can be locked and unlocked by means of a motor. Said lock comprises a locking element (10) which can be moved between a locked position and an unlocked position, and a central interlocking drive (12) having a slow driving element (13) for moving the locking element (10). Said door locking system also comprises a control electronic (3) with a passive input function, and a remote control module (5) held by a user. According to said invention, a coupler (14) which is particularly in the form of a centrifugal coupler and only engages from a minimum rotation speed is located between the central interlocking drive (12) and the driving element (13). Said coupler allows easy manual locking of the locking element (10) when the central interlocking drive (12) is stationary. In order to enable a quick unlocking of the inventive locking system, the central interlocking drive (12) comprises, on the coupler side (14), a quick unlocking element (15) which can be actuated upon start-up by the central interlocking drive (12). Upon actuation, the quick unlocking element (15) moves the locking element (10) or another element of the locking system, situated downstream from the locking element, from the locked position to the unlocked position; and, when the coupler (14) is engaged, the central interlocking drive (12) is moved slowly towards the unlocked position, or towards the next rest position, through the unlocked position.
