Abstract (en)

[origin: WO0191091A1] The device comprises a guide element and a profile that can be movably guided crosswise in relation to its direction of extension. Two hollow profiles which are open on their longitudinal sides extend along said profile, the hollow profiles receiving the edges of the foil material to be stretched. Stretching means are provided for stretching the profile crosswise in relation to its direction of extension in any direction in which the hollow profiles are located. The guide element is obliquely mounted on a frame or a structure so that the profile can be moved and stretched in transverse direction relative to the direction of extension and obliquely relative to the direction of stretching of the foil material which is to be stretched. The poster holder has at least one such device, which is mounted on a free-standing frame or forms such a frame or is mounted on a structure. The stretching profile can be moved and stretched in transversal direction relative to its direction of extension and obliquely relative to the direction of stretching of the foil material that is to be stretched. The stretching forces are solely received by the device.
