Abstract (en)

The present invention provides a container for accommodating sealants and the like. As compared with a conventional cartridge, the container after its content is run out can be more easily treated, resulting in largely cutting off the cost required for treating the empty container, and also the cost for producing the container can be lowered. When used, the container is capable of extruding the content at the same workability as a conventional extruding gun by use of the conventional extruding gun and the like. At one end portion of a pouch 1 which accommodates a fluid with high viscosity such as a sealant in a hermetic state, an extruding outlet 2 including an extruding nozzle 22 is attached. The pouch 1 is perforated at the position where the extruding outlet 2 is attached to the pouch 1. In this state, taking advantage of flexibility of the pouch, the content can be extruded at the same workability as a conventional rigid cartridge by use of a conventional extruding gun. The volume of the container after the content is run out can be reduced to the size of about a several tens of a conventional cartridge. <IMAGE>
