Abstract (en)
[origin: EP1284325A2] Concrete wall element (1) for a road retaining system is connected in a force-locking manner via anchoring elements (3) to support elements (2). At least one of the anchoring elements in the edge region of the support elements is designed as a deformation element (31) having a free length between the support element and the concrete wall element. Independent claims are also included for reflector walls for roadways comprising the above concrete wall element. Preferred Features: The free length of the deformation element is greater than its smallest cross-section in the region of the support element. The outermost anchoring element is the deformation element. The support element is a steel profile element.
