Abstract (en)

[origin: EP1284548A2] A useful data area of a frame is divided into at least one channel. A number of pointers are allocated to the channel based on its data rate. The pointers point to memory addresses at which the data are stored. In dependence on the time, the channel may be allocated a new data rate and a new number of pointers. A maximum number of pointers may be preset, so that data for which pointers are no longer available are no longer processed. An Independent claim is also included for an apparatus for processing data.
