Abstract (en)

[origin: WO0187385A1] A device and method for reconstituting a lyophilised drug, wherein the drug is stored under vacuum in one compartment of the device, and the solvent in another compartment at substantially atmospheric pressure, and means for connecting the compartments so that the vacuum causes solvent to flow into the drug compartment, thereby dissolving the drug. Alternatively, the drug or other material may be stored in liquid form in one compartment of the device, and caused to flow into another by the use of a vacuum.
