Abstract (en)  
[origin: WO0187666A1] Device in a head rest which is adjustable between a first position and a second position. A coil mechanism (8) applies an adjustment force which attempts to adjust the head rest from the first to the second position. A locking mechanism (11) retains the head rest in the first position. An activation mechanism (12) adjusts the holding mechanism to a release position. The locking mechanism (11) exhibits a locking part (15) which absorbs the adjustment force. A locking catch (16) interacts both with the locking part and with the activation mechanism. The locking catch is, by means of the activation mechanism, adjustable between a holding position in which the locking part is held in a locked position and a position which releases the locking part.
