Abstract (en)

[origin: WO0192628A2] The invention relates to a sewing machine comprising a device for steering towards a predetermined end (E) of a seam (B1). According to the invention, the alternating movement of the feed elements of the sewing machine, which occurs when the stitch adjusting device is set, is taken into consideration in the calculation of the target stitch length (Sb) of the final, optionally shortened end stitch (NRe) of the seam, in such a way that a setting value that deviates from the target stitch length is produced.
