Abstract (en)

[origin: DE10025908A1] The invention relates to an electronic circuit arrangement comprising a circuit breaker. The circuit breaker comprises an on-off switch; a first interface; a voltage divider; a connection for an external voltage supply; a ground connection. The interface is connected in a flexible manner in the form of an input and output for detecting a state. The circuit breaker comprises a second interface which is used to connect an evaluation and/or diagnostic unit.

[origin: DE10025908A1] The expanded function of the power switch is obtained by using a simplified design giving use of an input as well as an output via an interface (2) and allowing diagnosis of all conditions and states of the electronic circuit, via a second interface (6) with connection to a diagnosis unit (not shown). A second voltage divider (7) is connected before the second interface (6) for dividing the voltage at the second interface.
