Abstract (en)

[origin: WO0186934A2] The invention relates to a method for signaling the call of a call-communication device (1) reaching a communication terminal (2). The aim of the invention is to enlarge the possibilities of allocating identifications to such calls. To this end, at least one identification signal (S7,S7') describing an identification is transmitted to the communication terminal (2) by the call-communication device (1) when the call is sent and the communication terminal (2) outputs the corresponding identification in response to the identification signal (S7,S7') in the form of an acoustic sound.
