Abstract (en)
A picture frame includes a back (B) and a rear support (T) slidable along a pair of slots (A) formed in the back (B), the connection between the support (T) and the back (B) being achieved through a first member provided with hookings (G) and fixed at the top of the support (T), and a second member provided with longitudinal toothings (S) and fixed to the back (B) astride the slots (A), the hookings (G) and the toothings (S) being shaped to engage so as to achieve both the hinging and locking function for the support (T). In this way it is possible to adjust in a precise and repeatable way the position of the support (T) according to the different widths which the frame may have and/or to change the angle of inclination of the picture frame, and furthermore the support (T) can be easily removed to hang the frame on the wall and then subsequently reapplied to use it as a table frame. <IMAGE> <IMAGE>
