Abstract (en)

[origin: EP1286318A2] A coin deposit lock has a housing (30, 40) in which a coin or key is used to move a key bolt (10) between two end positions in a lock chamber formed by the housing and a function part (20) that interacts with the key bolt to cause blocking of coin or key. The key bolt moves linearly along an axis within the housing. The function part is controlled by contours on the key bolt that cause it to move in a continuous manner to block key or lock.
