Abstract (en)  
[origin: WO0178898A1] A description is provided of a roller press comprising two oppositely rotating rollers (1, 2) which are driven by means of a drive system. The roller press is peculiar in that the drive system is designed so that its lowest natural torsional frequency  $V_{system}$  is greater than a calculated frequency expressed by formula (I) where V represents roller velocity, D roller diameter, H grinding bed thickness,  $\rho$  out density of pressed cakes,  $\gamma$  bulk weight of feed to roller press. This will allow the roller press to be designed for operation at roller peripheral velocities in excess of 1.5 m/s.
