Abstract (en)
[origin: EP1160527A1] A bath condenser comprising a condenser block having vaporization passages for a liquid and liquefaction passages for a heating medium; and two vertically arranged circulating sections (7). A bath condenser comprises a condenser block having vaporization passages for a liquid and liquefaction passages for a heating medium; and two vertically arranged circulating sections (7). The vaporization passages each have an inlet opening for a liquid on the lower end of a circulating section and an outlet opening at the upper end of a circulating section. Each circulating section has a liquid storage container in flow connection with the inlet opening and the outlet opening of the circulating section and has a gas drain (18). The inlet into the gas drain is next to the condenser block which is arranged through the side of the circulating section.
