Abstract (en)

[origin: WO0182406A1] The invention concerns relay antenna masts for a cellular radio-telecommunication system, characterised in that it comprises: a mast foot (1); at least an arm (3) which is mounted pivoting on said mast foot (1) and bearing at least an antenna (5); means for locking said arm in a position wherein the antenna(e) are in high position, said arm (3) being adapted, when the locking means are released, to be pivoted about its pivot pin (4) down to a position where at least one antenna is at a height where an operator can operate thereon at the mast foot.
