Abstract (en)
[origin: DE10142551C1] The boiler consists of three sections, with water chambers connected via hubs. A shell-shaped combustion chamber section (3) is enclosed at a distance by the first sections (1,2), to define a combustion chamber (4), and is also connected to the first sections via hubs (5,6). The intermediate distance between the sections forms heating gas flues (10,11), which are divided into flow channels. The combustion chamber section mainly forms the back wall of the chamber, and has openings (9) for heating gas transfer from the combustion chamber into the flues.
