Abstract (en)
[origin: WO0196702A1] The invention relates to a construction element, especially an element for a facade, separating a cold area (5) from a warm area (6), comprising a support (1) which is made of an outer part (16) which is oriented towards the cold area (5) and an inner part (15) which is oriented towards the warm area (6). Part of a capping piece (11) for the frame separates the carrier (1) between the outer part of the support (16) and the inner part (15) of the support or the heat conducting section (4) located therebetween is reduced in size. As a result, it is possible to produce an appropriate thermal insulation in a simple manner.
