Abstract (en)
[origin: WO0149068A2] The invention relates to a method for adjustment of a hearing aid to suit an individual. The method comprises, firstly, measuring the auditory sensitivity of the individual and quantifying the same by: (a) parameter(s) which may be weighted with a first factor. Further, a normal audio relationship, or the parameters thereof, are weighted with a second parameter and, finally, the weighted audio relationships, or the parameters thereof are used for determining the optimum hearing aid settings for the individual. According to the invention, the method has the advantage that a hearing aid can be significantly better adjusted to suit the individual.
