Abstract (en)

[origin: WO0198139A1] The invention concerns a rigid container having a generally horizontal elongated and non-parallelepiped shape, for containing a pneumatic inflatable life raft in deflated and folded state, said container (1) being formed by two respectively upper and lower mutually assembled half-shells (2, 3). The invention is characterised in that at least the lower half-shell (2) has, on its outer convex face, a zone with generally planar axial surface (6) whereby the container can rest in stable position on a subjacent substantially planar support surface.
