Abstract (en)

[origin: EP1293315A2] The assembly to compact and shape mixed materials, and especially concrete, has a rigid mold (1) with a center of gravity (S), on elastic mountings (2). Four independent oscillation units (3.1-3.4) apply vibrations to the mold in a preferred direction without synchronization restraints. The energizing centers of the four oscillation units are in a symmetrical array around the center of gravity, within given tolerances, as imbalance units on parallel axes, with their relative directions of rotation set through their symmetrical array.
