Abstract (en)

[origin: WO0200545A1] The invention relates to a device which allows vertical springs (3) that have been sealed in pockets to be repositioned. A pivoting rod (13) makes contact with the uppermost ends of the spirals and displaces them laterally in the spring pocket (1). If the spring (3) cannot be repositioned at the first displacement attempt, said spring re-enters the pivoting range of the rod (13) at least once more and is then repositioned together with the subsequent spring (3).
