Abstract (en)
[origin: WO0182133A2] A method and apparatus for automatically flattening an XML file. XML files are stored in a client or server. The user specifies one of the XML files or a particuliar subset of the selected XML file to flatten. The user also specifies which elements and/or attributes of the selected subset of the XML file is of interest. The elements and the attributes of interest to the user for the selected subset are then parsed by a parser process. The parsed elements and attributes are then automatically arranged into a flat format having rows and columns as defined by the user.
