Abstract (en)

[origin: EP1295681A2] A system for dressing grinding wheels has the grinding wheel applied with conglomerates of cutting elements secured by a bonder and applied to the wheel by a second bonder. The dressing wheel has larger cutting elements, approximately an order of magnitude larger than the separate elements in the conglomerate, and which can cut through the conglomerates. Typical cutting elements have diamond grit of diameter 0.02 to 0.07 mm in the working wheel, with 3 to 15 elements in each conglomerate, and with diamond ships with a mean diameter of 0,7 mm for the dressing wheel.
