Abstract (en)

[origin: EP1296292A1] The deposit comprises a number of disc-shaped elements or partitions (2) arranged parallel to each other to form a fully open cylindrical body (1) with its longitudinal axis horizontal, so that the partitions or elements (2) define slots (3) for the coins (4) which arrive from the validator/selector (5), and with said coins (4) resting on a false floor (6) which envelopes a certain angle of the bottom perimeter of the deposit formed by the cylindrical body (1). This false floor (6) is provided with a groove (8) so that when said floor turns in one sense a coin (4) will fall towards the collection hopper, while when the floor (6) turns in the opposite sense all the remaining coins will fall towards the return hopper.
