Abstract (en)

[origin: FR2829870A1] The fuse carrier moves from a first, closed position to a second, open position. A lever (20) extension (205, 206) is located in the path of one of the components (43). The fuse (5) is connected to jaws of the isolator (1) in the closed position, and can be extracted from the fuse carrier (4) in the open position. The lever is moved by interaction between the extension and the carrier, as change over occurs. The lever actuates the preliminary cut-out control (15)
