Abstract (en)  
[origin: WO0196699A1] System (1) for windows, doors and the like, comprising at least one pawl (4), ratch and/or bolt and at least one striker plate (3) adapted hereto, said pawl (4), ratch and/or bolt is adapted for engagement in at least one recess (5) in the striker plate (3), said pawl (4), ratch and/or bolt during closing substantially having at least a part of a front surface (12) which has contact against or is placed at a short distance to a first inner wall (6) in the recess (5) in the striker plate (3). The first inner wall (6) comprises a first wall part (7) and a second wall part (8) with a first and respectively second distance to the centre plane (11) of the recess measured in relation to the first wall part (7), which first distance is less than the second distance, and that the front surface (12) of the pawl (4), ratch and/or bolt comprises a pin/boss (13). There is hereby achieved a system comprising such a pasquil lock, and where the risk of break-in via the window or the door is eliminated, in that the lock itself comprising striker plate and a pawl is configured in such a manner that the forcing of these parts out of engagement with each other is rendered impossible.
