Abstract (en)

[origin: WO0199060A1] The invention relates to a method and device for processing sheet-like articles, especially bank notes, documents of monetary value and the like. When verifying the sheet-like article for compliance with criteria, at least one group of sheet-like articles which fulfills the criteria and one group of sheet-like articles that do not are formed. The group of sheet-like articles that does not fulfill the criteria is separated into at least two subgroups. This makes it possible to separately process the subgroups during post-processing, and to particularly focus on the presence of certain problems or faults, e.g. forgeries. This results in an overall facilitation with regard to post-processing, whereby the level of complexity is reduced.
