Abstract (en)

[origin: EP1297908A1] Process for pre-adjusting and regulating the strip flatness during rolling of a strip-like material comprises: determining the adjusting parameters by online access to a multi-dimensional data matrix produced using a FEM model for all adjusting regions of rolling force, rolling shift and bending regulation during rolling of a thickness incline to adjust a desired strip profile shape. <??>Preferred Features: The strip profile shapes for stepped adjusting regions of the rolling force, rolling shift and bending regulation are determined to reduce the data amounts of the data matrix.
