Abstract (en)  
[origin: WO0206889A1] The invention concerns an electrochemical device, in particular an electrically controlled system with variable optical and/or energetic properties or a photovoltaic device, comprising at least a support substrate (1) for an electrically active stack of layers (3) arranged between a so-called lower electrode and a so-called upper electrode. Each electrode comprises at least an electro-conductive layer (2) electrically connected to at least an electric current supply. Said electric current supplies are arranged outside the support substrate (1) zone which is covered by the electrically active stack of layers (3).
