Abstract (en)  
[origin: WO0188723A1] A method of processing a domain name tree is disclosed. The domain name tree includes a domain name segment and at least one undefined sub-domain segment (52). Command parameters are extracted from the sub-domain segment and are converted to terms, such as search terms, address fields and the like (56). The terms are then manipulated, either under a predefined process or a dynamically selected process identified by attributes of the domain name tree or other data (60). A result is thus derived from the extracted terms.
