Abstract (en)

[origin: EP1300235A1] The press cushion (1), for a laminating press, has a textile carrier (2), of cotton or rayon and synthetics which can be removed to form fabric openings, with filaments (3-5) partially formed of heat-conductive filaments in contact with other filaments so that heat is transferred from one side of the cushion to the other. <??>The filaments are of metal or carbon, or a combination of metal and carbon. The carrier has a padding layer (7) of a rubber-elastic material, which can withstand temperatures of at least 200 degrees C. The padding layer is thinner than the carrier, and is embedded into the carrier so that the heat-conductive filaments project over it on both sides.
