Abstract (en)  
[origin: EP1300524A2] The glass roof (2) is particularly for a winter garden and has several parallel, adjacent window fields (5), which are inclined in a rising manner from the building (1) front side (3) to the building rear side (4). The window fields are coverable by a shading component, such as a sheet, a Venetian blind or a roller blind, which can be drawn from bottom to top over the fields. In the non-covered position of the shading component it is wound up at the deepest point of the window field. <??>At least one window field (5) is divided in the uppermost area into a further additional window (6), whereby the residual window field (7) beneath the additional window is covered by the shading component and the additional window is free of the shading component.
