Abstract (en)

A powered hand-tool comprising a housing containing a motor and a shaft rotatably driven by the motor, the shaft extending, at least in use, to the exterior of the housing, the motor and shaft being movable with respect to the housing against resilient means also contained in the housing, such that pressing the shaft in a first direction directly or indirectly against a workpiece via the housing with a force sufficient to overcome a return force provided by the resilient means causes the shaft and the motor to move with respect to the housing in an opposite direction, such movement causing, in use, actuation of the motor, and hence rotation of the shaft. <IMAGE>
