Abstract (en)
[origin: WO0209548A1] Known adjustable press-stud fastenings (10) consist of at least two complementary press-stud parts, namely a male and female part (11, 12), which can be snapped together for producing a connection. At least one press-stud part (11) is attached to a support layer (19) using a connecting piece (21). The other press-stud part (12) can likewise be connected to a support layer (20) using a connecting piece (21), or can be connected directly thereto (20). The adjustable press-stud fastening (10) allows the support layers (19, 20) to be superimposed, by the connection of the male part (11) to the female part (12). Said superimposition can be modified by the adjustable press-stud fastening (10). The connecting piece (21) must be capable of adapting to its support layer (19) in order for the press-stud fastening (10) to be additionally used for articles of clothing, such as jackets, trousers etc. In addition, the invention aims to provide a simple and secure adjustment of the press-stud fastening (10). To achieve said aims, the connecting piece (21) consists of a flexible material, enabling it to follow a deformation of the support layer (19) and complementary locking means are provided in the connecting piece (21) and in an indirectly positioned press-stud part (11), enabling a permanent, secure positioning of the press-stud part (11) onto the connecting part (21). In addition, said press-stud fastening (10) should consist of a small number of parts that are simple to produce.
