Abstract (en)  
[origin: WO0209971A1] A platform with ramp, which ramp, in a first position, can function as a riding surface for moving objects on and off the platform and, in a second position, can function as a protection against riding off or otherwise moving off of objects from the platform, which ramp comprises a first profile substantially comprising the riding surface, which first profile (10) is pivotally connected to a second profile (12) which is connected to the platform, while a third profile (14) is provided which is connected near a first side to the first profile and, at a distance therefrom, is connected with an operating device for the ramp, while with the aid of the operating device the third profile can be brought in a first, blocking position in which at least pivotal movement of the first profile from the second position to the first position is prevented and in a second, pivoting position in which the first profile with the aid of the operating device can be moved between the first and second position.
