Abstract (en)

[origin: WO0208596A1] The invention relates to an internal combustion engine comprising an odd number of cylinders. Said engine is synchronized without a camshaft sensor, by measuring the crankshaft angle when the engine is started, from the internal combustion engine at rest up to the detection of the first interval between the teeth of a sensor wheel, using a crankshaft sensor and said angle is assigned to a specific cylinder, with which the internal combustion engine is then synchronized.
