Abstract (en)

[origin: WO0207370A1] The invention relates to a method for adjusting transmission parameters from a transmitter for digital radio signals, preferably radio broadcasting signals. According to said method, a receiver device receives the digital radio signals that have been emitted from the transmitter and transmits data to the transmitter via a backward channel, said data containing transmission data and receive parameters. The transmitter then optimises the transmission parameters, according to said data. In said data, the transmission data may contain either the received digital radio signals or data that has already been evaluated by the receiver device.
